These may be Borrelia burgdorferi, B. afzelii or B. garinii. These can be used as vaccines against Borrelia infection, which is spread by ticks and leads

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides compositions comprising ospC proteins and chimeric ospC proteins from members of the Borrelia genus. These may be Borrelia burgdorferi, B. afzelii or B. garinii. These can be used as vaccines against Borrelia infection, which is spread by ticks and leads to Lyme disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides compositions comprising ospC proteins chimeric ospC proteins from members of the Borrelia genus. These may Borrelia burgdorferi. B. afzelii or B. garinii. These can be used as vaccines against Borrelia infection, which is spread by ticks and less vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Compositions of OspC p

                                                      The present invention provides compositions comprising ospC protein chimeric ospC proteins from members of the Borrella genus. These members of the Borrella genus. These members of the Borrella genus. These os Borrella burgdorferi, B. afzelii or B. garinii. These can be used vaccines against Borrelia infection, which is spread by ticks and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides compositions comprising ospC proteins and chimeric ospC proteins from members of the Borrelia genus. These may be Borrelia burgdorferi, B. afzelii or B. garinii. These can be used as vaccines against Borrelia infection, which is spread by ticks and leads to Lyme disease.

"Complete nucleotide sequence and deduced polypeptide sequence nonmuscle myosin heavy chain gene from Acanthamoeba: evidence o hinge in the roditke tail.";

J. Cell Biol. 105:913-925(1987).

-i- FUNCTION: MYOSIN IS A PROTEIN THAT BINDS TO F-ACTIN & HAS A ACTIVITY THAT IS ACTIVATED BY F-ACTIN.

-i- SUBUNIT: MYOSIN II HEAVY CHAIN IS TWO-HEADED. IT SELF-ASSEM INTO FILAMENTS. HEXAMER OF 2 HEAVY CHAIN SUBUNITS (MHC), 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the European Bioinformatics Institute. THIS REGION IS INTERRUPTED BY A HINGE AND JOINED BY A NOHELICAL TAILPIECE WHERE THE REGULATORY PHOSEHORYLATION SITES RESIDE.

MISCELLANEOUS: THE HINGE REGION MAY PLAY A KEY ROLE IN MEDIATING THE EFFECT OF HEAVY CHAIN PHOSEHORYLATION ON ENZYMATIC ACTIVITY.

SIMILARITY: CONTAINS 1 MYOSIN-LIKE GLOBULAR HEAD DOMAIN.

SIMILARITY: CONTAINS 2 IQ DOMAINS.
